INTRODUCTION

THE IDEA

IMPLEMENTATION

APPLICATIONS

Introduction

Why do we need a smart Entry system for visitors?

1. **Better Security:** Verifies visitors and prevents unauthorized access.
2. **Faster Check-ins:** Reduces wait times with pre-registration and QR codes.
3. **Real-Time Alerts:** Notifies hosts instantly and tracks visitor data.

The IDEA

The Idea in 3 Steps

1. Registration

- Visitors register themselves upon arrival using a website.
- The system collects details such as the visitor's name, purpose of visit, contact information, and a photo.
- Upon successful registration, a unique entry pass (QR code) is generated for the visitor.

2. Verification by the Guard

- The visitor presents their entry pass to the security guard at the gate.
- The guard scans the pass or verifies the details through the system, ensuring the visitor's identity matches the registration data.
- Only verified visitors are allowed entry, enhancing security.

The Idea in 3 Steps

3. Exit Logging

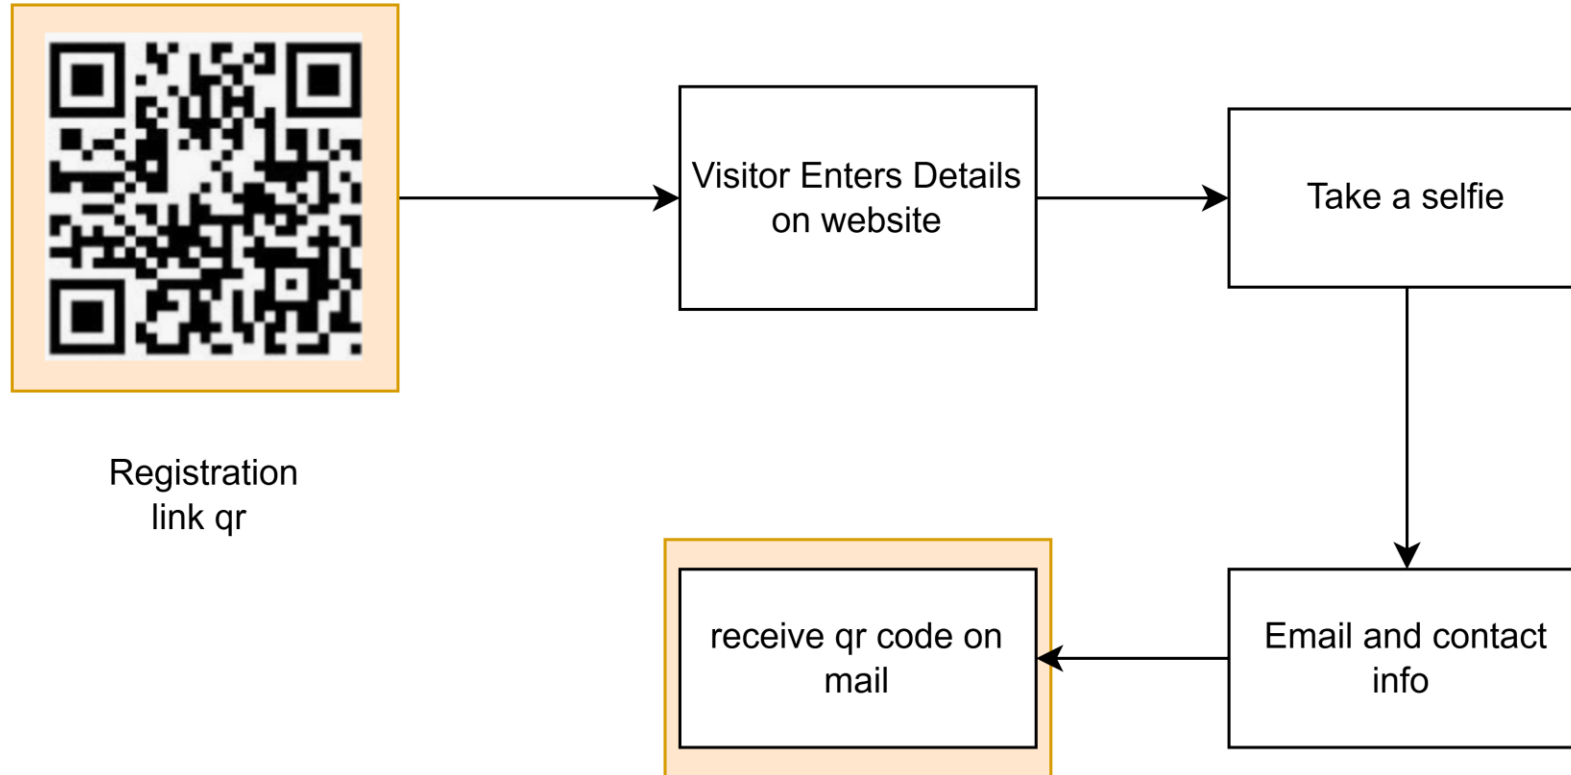

- At the time of exit, visitors check out by scanning their pass.
- The system logs the exit time automatically, maintaining a complete record of the visit.
- This ensures accurate tracking of visitor movements on campus.

Additional Features: Visitor Dashboard

- A central dashboard displays real-time analytics, including:
 - **Current Visitors:** Total number of visitors currently on the premises.
 - **Daily Statistics:** Insights like the number of visitors per day, peak hours, and frequent visitors.
 - **Security Reports:** Comprehensive logs of visitor entry and exit.
- The dashboard helps administrators monitor and analyze visitor patterns for better resource planning and security management.

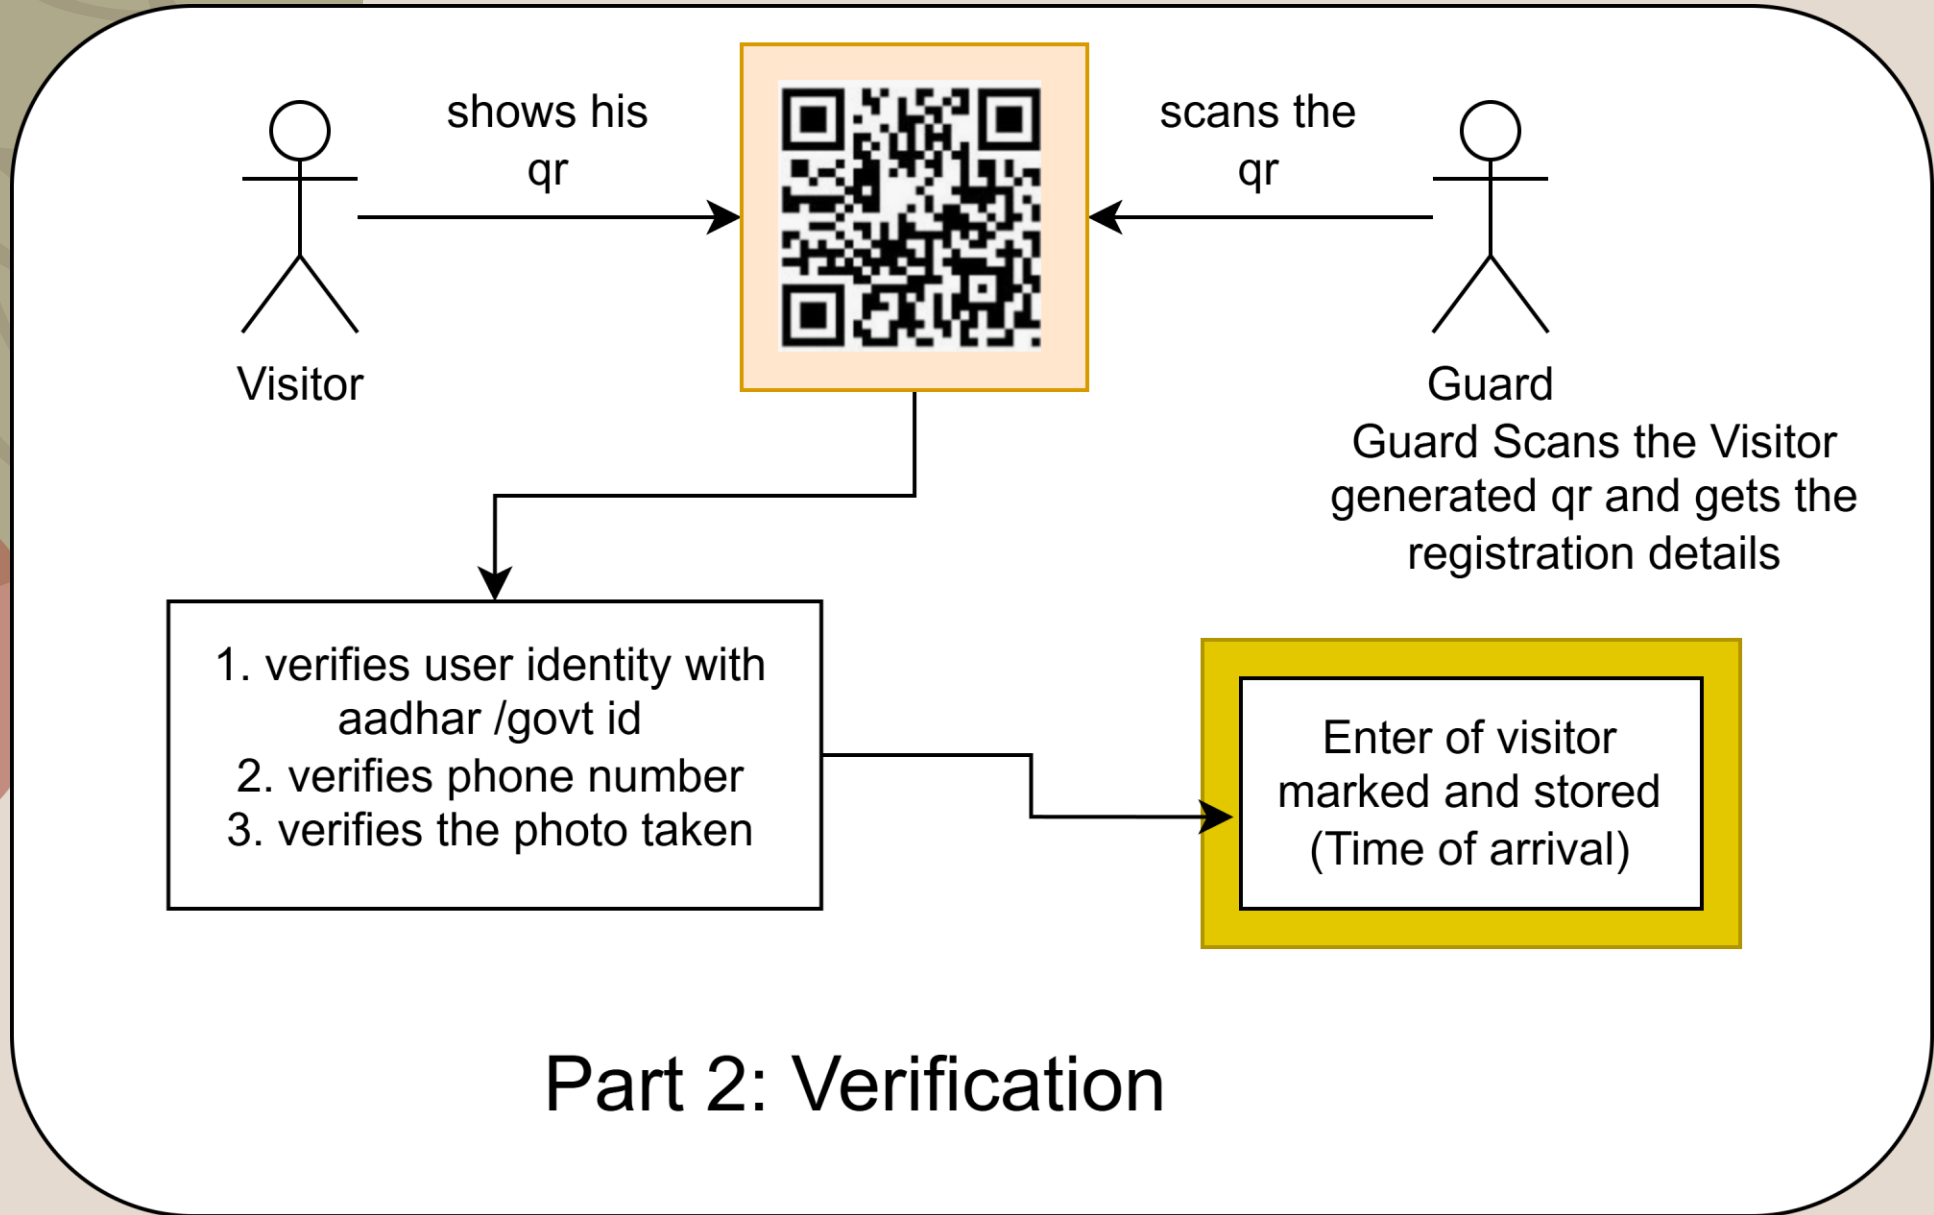

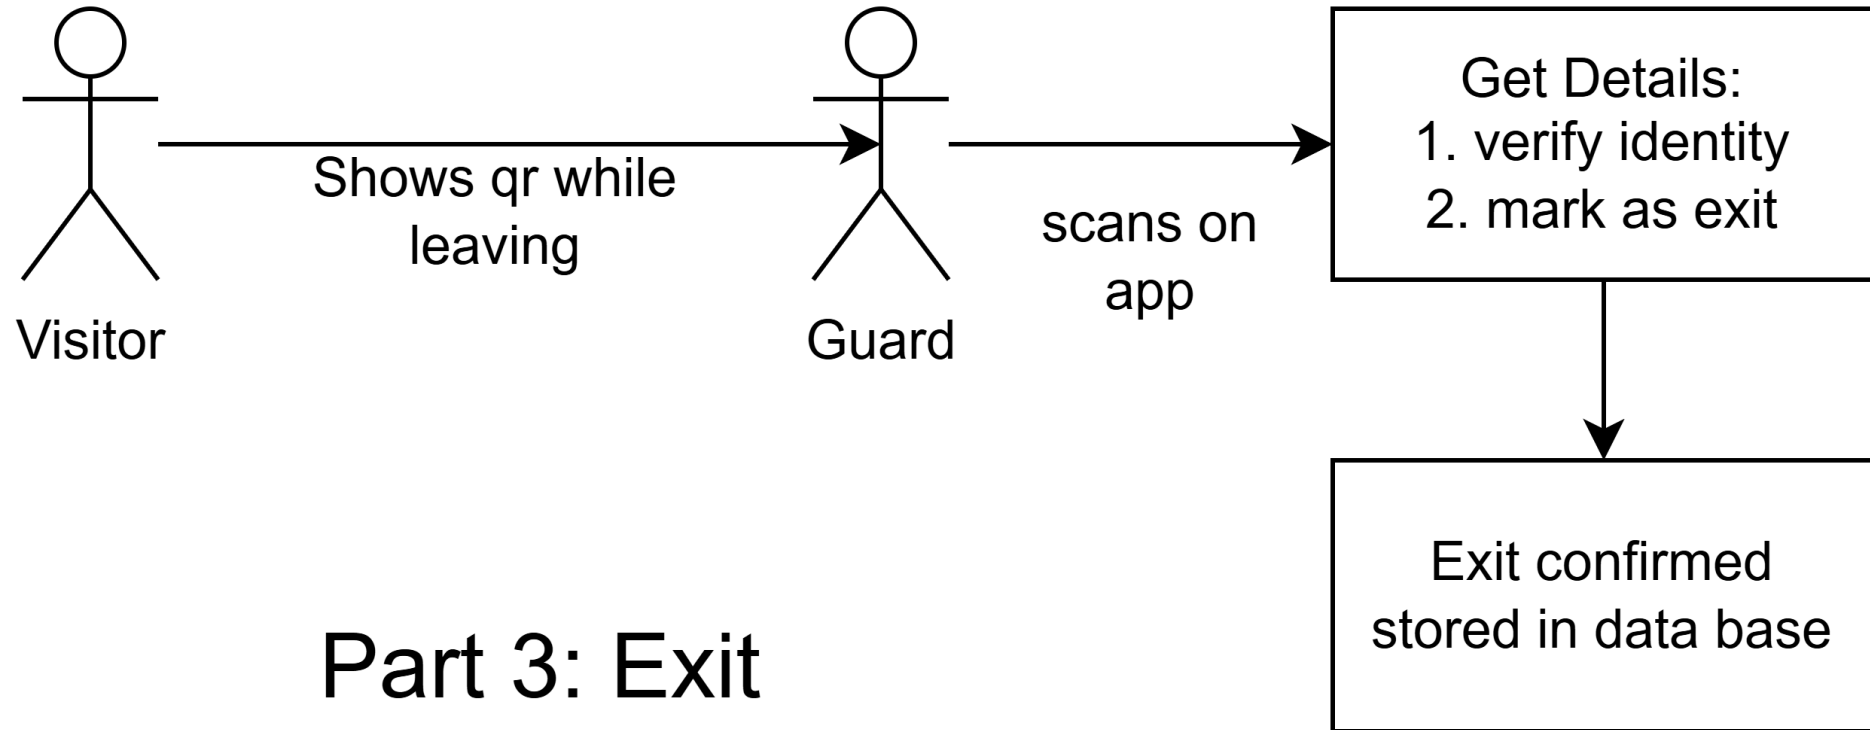

IMPLEMENTATION

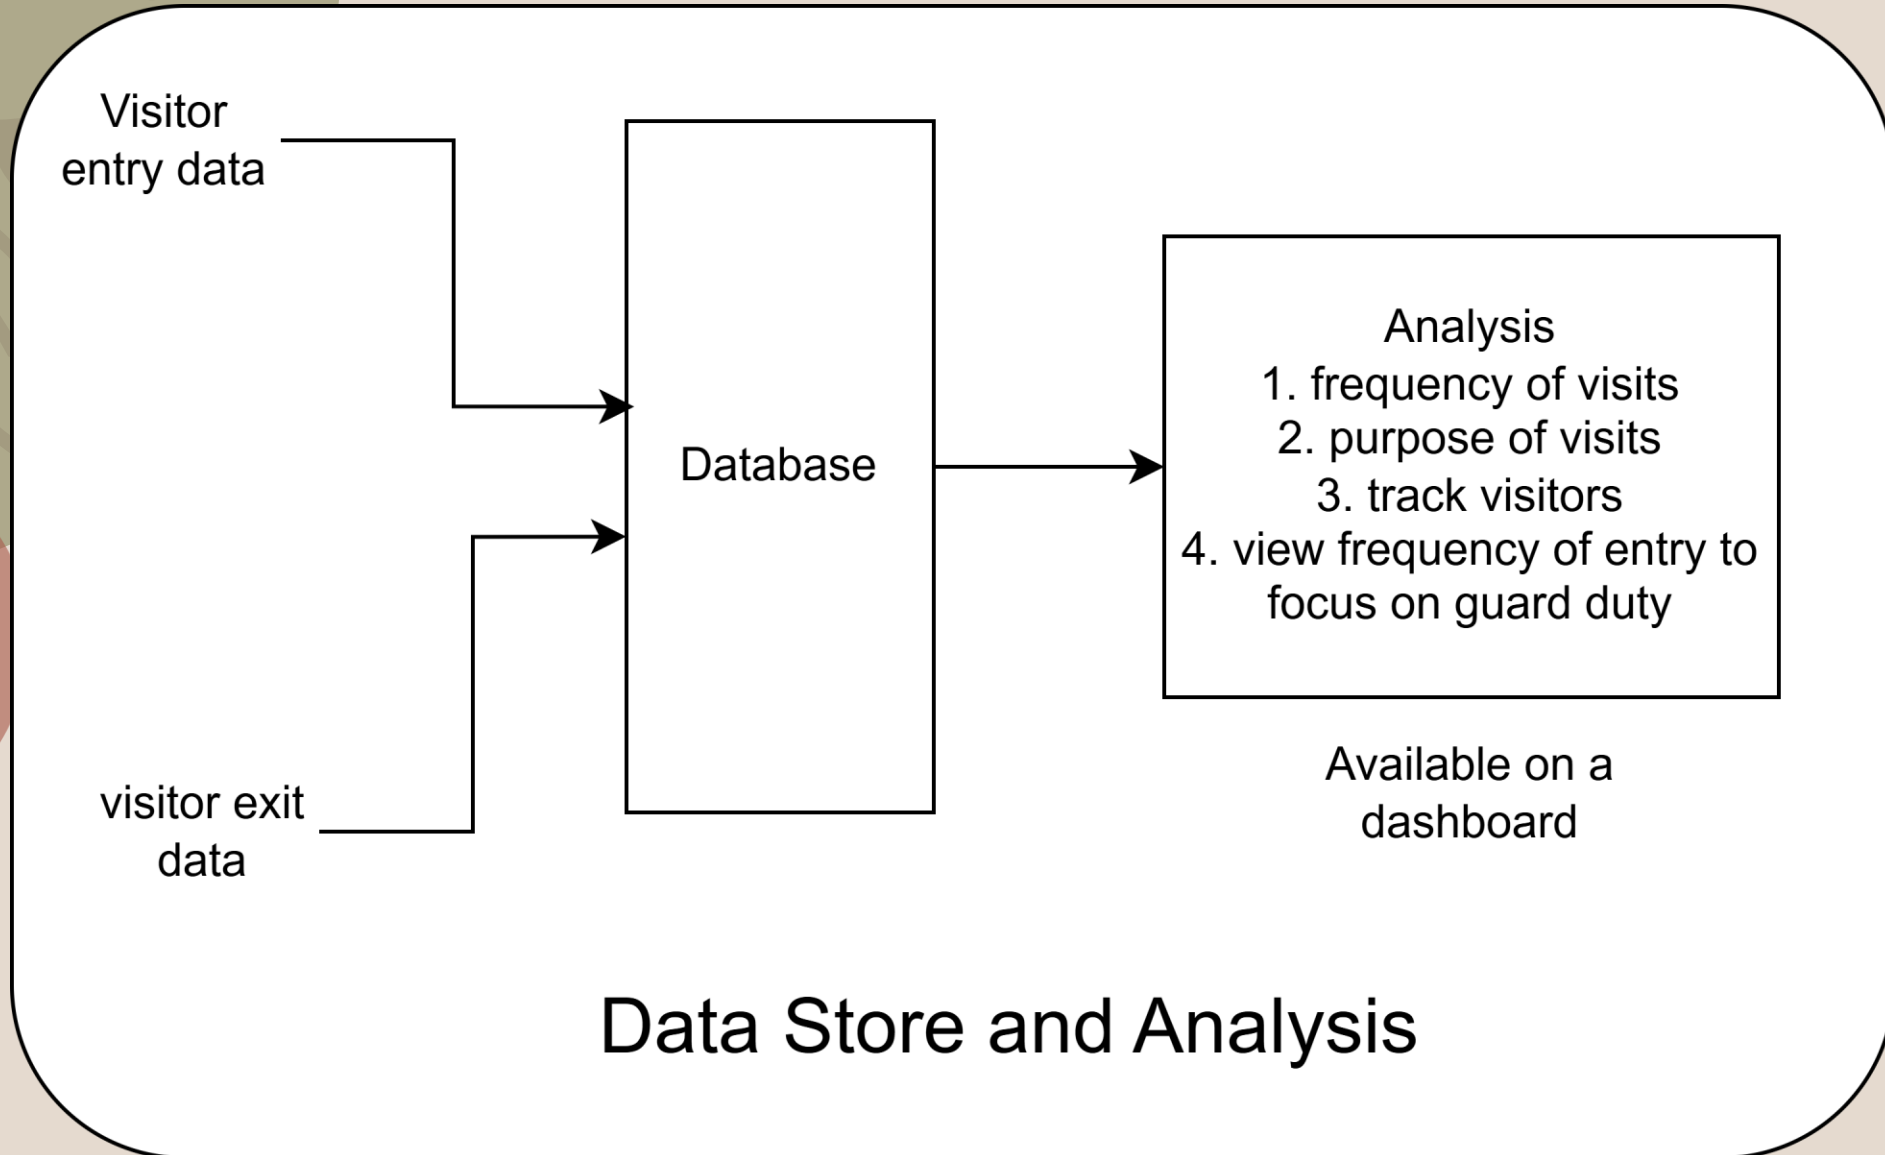

Part 1: Registration

1. registration deployed website
2. qr code generator and mail sender

APPLICATIONS

APPLICATIONS

1. Registration Website

- A normal web application deployed which takes user info and generates a QR and sends it to their mail.
- The Visitor's data is securely stored in a database.

3. Database

- stores registered user's data.
- Used frequently by the analytics dashboard to display the visitor analytics.

2. Guard Mobile application

- The mobile app which the guard has, will scan the QR and verify the user details like face, Aadhar, phone number.
- Retrieves the data from the secured database.
- Used for both entry and exit.

4. Dashboard

- A deployed application, which retrieves the data from the database to display the visitor stats.
- includes live visitor count and visitor analytics and much more.

thank you
